Reflection Paper

To accomplish the conversion rate we desired, we had to figure out how to combine the implementation of the technical structure with the branding strategy. The layout problem was that we could only use an extremely simple vertically oriented card. The reason behind using Flexbox was that it was possible to align all elements of the layout according to its only dimension (display: flex; align-items: center), thus making it possible to place the image of the product and its information side by side for desktop while being still able to arrange everything appropriately on the display.

When it comes to typography, we settled the typography spacing and hierarchy as we consider it important for the readability of the text. We also decided to retain a neutral background rgb(237, 236, 234) and the typeface Neue Haas Grotesk. Instead of black color #000000, we opted for dark indigo blue hsl(257, 24%, 20%) for the price and product information. This is due to the fact that it refers to luxury items and therefore, it would be inappropriate to use a pure black color in the design.

Regarding the interaction design, the main buy-btn was designed with a dark blue color (#1b1c3b) and it uses smooth transitions. This button gives the user tactile feedback as it changes color and scales a little (transform: scale(1.02)) when hovering over it. If the CTA were less visually distinct, users might overlook the buy button and feel uncertain about proceeding, thus, creating friction and lowering conversion rates.

The layout setup changes to column flex direction at the mobile breakpoint (@media (max-width: 768px)) and the images appear above the details, while the button changes to occupy the entire width making it easier to be tapped with the thumb. The modular component classes like .product-card ensure that our code is readable and scalable even upon enabling the usage of 30 more products.

From a business perspective, our main objective was to achieve higher Add-to-Cart conversion rates by establishing visual trust and increasing perceived product value. When a user sees a professionally designed, high-quality layout paired with an accessible price tag, the hesitation to purchase decreases. In case the conversion rate remains unsatisfactory following our redesign, the first step we would take would be to implement trust symbols. For example, we could place small 'Secure Checkout' badges or logos of payment systems near the button to assure visitors that they can shop safely. Additionally, we could try adding rating stars or reviews right under the price.
